

**GULLELA BARNARDI VAN BRUGGEN, 1965
(MOLLUSCA, PULMONATA: STREPTAXIDAE). A
NEW RECORD FROM THE KRUGER
NATIONAL PARK**

Several specimens of molluscs, collected in the Kruger National Park, Republic of South Africa, were received by the author for identification. These molluscs were collected by U. de V. Pienaar on 1976.12.18. The locality was given as Khandizwe 2531 Ad.

Identification and comparison with material in the Natal Museum proved that most of these molluscs have already been recorded by van Bruggen (1966, 1968) as being present in the Kruger National Park. An exception were a few specimens of the streptaxid *Gullela barnardi* van Bruggen, 1965. On comparison these specimens resembled the holotype very well. The most significant difference from the paratypes is that the minute sinular denticle, which is very distinct in the paratypes, is absent or only present as a weakly developed swelling in the Khandizwe specimens. According to van Bruggen (1965), however, this denticle or swelling may be absent.

Gullela barnardi was described for the first time by van Bruggen (1965) on strength of shells collected by R. F. Lawrence near Nelspruit in January 1939. Although van Bruggen (1965) states that this species had so far not been found in the Kruger National Park, he hints that it should be present there.

Specimens will be deposited in the Natal Museum.
